

Mobile Solutions

SECURITY MANAGEMENT IN THE FIELD

Built on the StarWatch™ SMS platform and the latest in wireless communications technology, DAQ's mobile application is specifically designed for installations that require security personnel to be on the move. Using hand-held devices, guards are able to manage personnel credentials, monitor entry/exit points, and respond quickly to alarm situations, all while communicating in real time with a centralized database.

Via the StarWatch mobile interface, the power of superior access control technology is brought from the desktop into the field, allowing security teams to maintain complete situational awareness across multiple secure sites.

SYSTEM FEATURES

- Seamless, real-time interface with main access control database
- Efficient processing of high-volume traffic, with provisions for personnel, visitors, and on-site contractors
- Customized reporting and instant notification of system events
- Flexibility to address a wide range of applications and expand to multi-site, Enterprise-class operations

Local administrators can configure processes and procedures to facilitate the secure, on-site movement of thousands of visitors, employees, and vehicles on a daily basis. In a typical configuration, guards stationed at multiple entry control points use wireless mobile devices running StarWatch mobile to scan ID cards as individuals enter and exit access zones.

Incorporating a powerful database structure and an intuitive operator interface, StarWatch SMS provides the flexibility required for mobile access control applications

Interfacing with the central database, the application instantly indicates whether a card is valid for entry at a location, displaying related cardholder details, such as organization, date of birth, permission level, and photograph. Each access event is permanently recorded in the system, creating a searchable log that tracks where and when specific individuals have been processed. Using an embedded reports feature, operators can easily create customized, multi-layer reports displaying access control events and trends.

SIMPLIFIED DESIGN

Within the mobile configuration, an advanced communications architecture allows for optimized device-to-server connectivity.

Personal Digital Electronics

Mobile Computer Clients

Equipped with PDEs and vehicle-mounted laptops, security personnel access the StarWatch database in real-time from anywhere within or near secured zones. Peripheral devices, such as ID card scanners, interface directly with the system server to ensure that all on-site movement is strictly monitored, controlled, and recorded.

Wireless Access Point

StarWatch SMS Server

Via a sophisticated data sequencing process, information is transferred to and from in-field mobile devices. Wireless access points act as exterior information hubs, ensuring that all remote workstations are continuously updated.

A fully integrated, mobile verification system enables the processing of access control credentials from any operator/guard station

Mobile systems also provide an interface to the complete suite of StarWatch SMS monitoring and control features, including dynamic area maps, alarm queues, and live surveillance video. As security needs expand, field devices and control modules can be added to the system.
